

Input:

when do you want to leave

Process:

Convert the time into minutes and hours

Add on the minutes for each station (we will have a 2D list that stores the place name and the time to get there e.g. TIMES = [["Crofton Downs", 7], ["Ngaio", 2]])

If minutes \geq 60, add one to the hour and set minutes back to zero

Output:

Each time we loop through the list, we print out the place name and the updated time and hours.
